

BUSINESS REQUIREMENTS DOCUMENT (BRD)

Project: IT Incident Process Efficiency Improvement

1. Executive Summary

Analysis of 24,918 IT incident revealed that while reopening rates remain low (1.1 %), reassignment rate is significantly impacting the resolution performance. Approximately 45.63 % of incidents were reassigned at least once, and incidents with multiple reassignments needs longer resolution time. Incidents with no reassignment were resolved in 4 days, while incidents with more than 20 reassignments required around 40 days. The project aims to improve incident resolution process, reduce unnecessary reassignments, and improve overall incident resolution performance.

2. Project Objective

- 2.1.** Reduce unnecessary reassignment of incidents.
- 2.2.** Improve efficiency to resolve incidents in first time.
- 2.3.** Reduce average incident resolution time from 7.36 days.
- 2.4.** Improve monitoring of incident workload and priority distribution.

3. Problem Statement

- 3.1.** Average incident resolution time is 7.36 days.
- 3.2.** 43.63% of incidents are reassigned at least once.
- 3.3.** Incidents with 20+ reassignments require approximately 40 days for resolution.
- 3.4.** Incident volume peaks between March and May, potentially increasing operational workload.

4. Scope

4.1. In Scope:

- 4.1.1.** Critical and high priority incidents only.
- 4.1.2.** Group 8, 18, 71 (bottom 3 performing teams).
- 4.1.3.** Resolution time reduction strategies.
- 4.1.4.** SLA improvement initiatives.
- 4.1.5.** Team training activities.
- 4.1.6.** Process Improvement recommendations.

4.2. Out Scope:

- 4.2.1.** Root cause investigation of individual incidents.
- 4.2.2.** Software upgrading
- 4.2.3.** Budget increase.
- 4.2.4.** Additional staffing requirements.

5. Stakeholders

5.1. Service Desk Team Lead

5.2. Incident Resolution Team

5.3. IT Manager

6. KPIs

KPI	Current Value
Total incidents	4,918
Average Resolution Time	7.36 days
Reopen Rate	1.10%
Reassignment Rate	43.63%
Average Reassignments	0.94

7. Key Findings

7.1. Moderate priority incidents accounts for the majority of workload (approx. 23.7k incidents).

7.2. Reopen rates remain low across all priority levels.

7.3. Resolution time increases consistently with reassignment frequency.

7.4. Incidents with no reassignment are resolved approximately 10 times faster than incidents with more than 20 reassignments.

7.5. Incident volume is highest during March–May.

8. Recommendations

8.1. Improve incident routing procedures to reduce reassignment frequency.

8.2. Implement monitoring for incidents exceeding 5 reassignments.

8.3. Review incidents with exceptionally high reassignment counts to identify routing bottlenecks.

8.4. Allocate resources proactively during high-volume months (March–May).

9. Assumptions

9.1. Historical incident data is accurate and representative of operational performance.

9.2. Current ticketing system can support the required monitoring activities.

9.3. Operational teams will adopt the recommended process improvements.

10. Constraints

10.1. Work with the existing ticketing system (no software upgrades)

10.2. Assignment group information contains missing values and was excluded from detailed analysis.

10.3. No disruption in the ongoing incident resolution during implementation.
